

Byte-Sized AI

Your plain-English update on AI in the real world

Issue 6 | August 2026 | Kashav Piya, AIMA-500

THIS ISSUE: Legal Tech | Marketing & Advertising | Healthcare

AI is no longer a back-room experiment. It is actively changing how lawyers work, how ads are made, and how doctors spend their time. This issue breaks down three industries where AI is delivering measurable business impact right now, with specific companies, real numbers, and a look at where each is headed.

AT A GLANCE

LEGAL TECH

54%

of corporate legal teams
now use AI (2025)

MARKETING

24hrs

to produce broadcast-quality
audio with ElevenLabs

HEALTHCARE

75%

of U.S. health systems
now use at least one AI tool

01 / LEGAL TECH

AI Is Becoming Standard Equipment at Law Firms

For years, law was considered resistant to automation. That changed fast. Corporate legal AI adoption doubled in a single year and in 2026, firms are embedding AI directly into daily workflows rather than treating it as a side tool.

CONTRACT MANAGEMENT

Agentic AI Is Handling the Paperwork Lawyers Hate

Corporate legal AI adoption jumped from 23% to 54% between 2024 and 2025. Agentic AI tools now handle routine contract approvals, compliance checks, and first-draft clauses without an attorney touching every step. Companies like Summize and Litera are leading this shift, embedding AI directly into the tools lawyers already use every day.

Impact: Faster contract turnaround and lower costs for clients, with attorneys freed up for judgment-heavy work.

Future potential: As agentic AI matures, entire matter workflows, not just individual tasks, will be automated end-to-end.

KNOWLEDGE MANAGEMENT

Summarization Has Become the Most-Used Legal AI Feature

AI summarization is now one of the most common real-world legal AI applications. Firms use it to convert long documents into reusable internal assets, speed up onboarding, and share knowledge across offices. What used to take hours of associate time now takes minutes.

Impact: Firms that build disciplined AI summarization workflows are turning institutional knowledge into a competitive asset.

Future potential: Long-form summarization will evolve into full knowledge graphs, connecting precedents across matters automatically.

02 / MARKETING & ADVERTISING

ElevenLabs Is Changing How Brands Sound

Audio content is expensive and slow to produce. ElevenLabs has changed that equation for marketing teams of all sizes, making broadcast-quality voice content accessible without a studio, a voice actor, or a sound engineer.

AI VOICE / AUDIO PRODUCTION

Professional Voiceovers in 24 Hours, No Studio Required

ElevenLabs has become the go-to platform for AI-generated voice content in marketing. Its 2026 updates added real-time dubbing in 32 languages, conversational AI voice agents, and a sound effects generator. Brands now produce broadcast-quality audio in 24 hours at a fraction of traditional studio costs, and the output is realistic enough that most listeners cannot tell it is AI-generated.

Impact: Smaller marketing teams can now produce at the volume and quality of agencies with much larger budgets.

Future potential: Multilingual dubbing will allow a single campaign to reach global audiences simultaneously, eliminating localization delays.

CONVERSATIONAL AI / SALES

ElevenLabs Voice Agents Are Now Answering Phones for Businesses

Beyond voiceovers, ElevenLabs offers a Conversational AI product that builds voice agents for inbound calls, outbound sales, and customer service. The agent listens, processes conversation with a language model, and replies in a natural voice in near real time. It connects to phone systems through providers like Twilio and works 24/7 without breaks.

Impact: Law firms, clinics, and service businesses handle overflow and after-hours calls without additional headcount.

Future potential: Voice agents will become the default first point of contact across industries, with human escalation reserved for complex cases.

AI Is Giving Doctors Their Time Back

Healthcare has two problems AI is uniquely suited to address: too much administrative burden on clinicians, and too much data for any single person to process quickly. Both are seeing significant movement in 2026.

Healthcare AI Adoption by Use Case (2026)

% of U.S. health systems using each application

CLINICAL DOCUMENTATION

68% of Health Systems Now Use AI for Clinical Note-Taking

75% of U.S. health systems now use at least one AI application, up from 59% in 2025. The most adopted use case is ambient AI note-taking. Tools like Microsoft Nuance DAX and Abridge listen to patient encounters and automatically generate clinical notes, saving clinicians multiple hours per week.

Impact: Physicians spend more time with patients and less time typing. Burnout driven by admin work is reduced.

Future potential: Ambient AI will expand from note-taking to real-time clinical decision support, surfacing relevant research mid-encounter.

DIAGNOSTICS & IMAGING

AI Is Catching Diseases That Slip Past Standard Screening

AI systems trained on large medical imaging datasets now perform at or above specialist-level accuracy on specific diagnostic tasks. A 2025 Nature Medicine study found AI-assisted diabetic retinopathy screening detected cases that standard screening missed. UnitedHealth projects AI will save nearly \$1 billion for the company in 2026 alone.

Impact: Earlier detection means better patient outcomes, especially in primary care settings where specialist access is limited.

Future potential: Multimodal AI combining imaging, lab results, and patient history will enable earlier detection of complex conditions.

The Bottom Line

Three industries. Three different problems. One common thread: AI is most valuable when it handles repetitive, time-consuming work so the humans in the room can focus on what actually requires their expertise. Legal teams are reviewing contracts faster. Marketing teams are producing audio in hours instead of weeks. Doctors are spending more time with patients and less time on notes.

This is not AI replacing people. It is AI changing what people spend their time on. And across all three of these industries, that shift is already well underway.
